

=> setState : It alters the value of the state object.

setState (stateObj, callback)

↓

Not sync

→ Always use previous state for updating the state with state object.

⇒ COMPONENTS LIFECYCLE

$\Rightarrow$ Mounting: Created & inserted into dom.

⇒ Updating: Re-rendering when prop or state is changed.

state is changing

=> Unmounting: Component removed from DOM.

=> Error Handling: Error is rendering lifecycle constructor.

=> Mounting: constructor, static getDerivedStateFromProps, render, componentDidMount.

=> Updating: static getDerivedStateFromProps, shouldComponentUpdate, render, getSnapshotBeforeUpdate, componentDidUpdate.

=> Unmounting: componentWillUnmount

=> Mounting Lifecycle

1) constructor

1)

- Binding Event Handlers
- Do not cause side-effects
(Eg: HTTP req)

11

(eg. redux)

2) static getDerivedStateFromProps (props, state)

11

↳ set the state
↳ Do not cause side effects

3) render() → only post JSX (vs axios)

11

4) componentWillMount()

↳ Interacts with axios or DOM.
